

# Exploratory Data Analysis on

## Zomato Restaurant Dataset

Gain meaningful insights into restaurant trends across cities using data visualization and analysis

Presented by: Sahana Shree V. S

Dept : B.Tech. in Artificial Intelligence and Machine Learning

# Which Cities Have the Most Restaurants?

=> Analyzed number of restaurants listed per city.

- Major metro cities dominate the restaurant listings, indicating high competition and food service activity.
- Urban hubs dominate food listings – The majority of restaurants are concentrated in a few major cities, suggesting that food delivery and dining businesses are more saturated in urban areas compared to smaller towns.

=> Found that the top cities are:

- Delhi NCR
- Mumbai
- Bengaluru
- Pune
- Hyderabad

# Most Common Cuisines & Average Cost by City

## Cuisines

- **North Indian cuisine is the most popular** across top cities, followed closely by Chinese and Fast Food options. This shows a strong consumer preference for familiar, comfort-style meals
- Top cities prefer diverse and mixed cuisines.
- Popular cuisines include: North Indian, Chinese, Fast food, South Indian, Beverages

## Average Cost

- Calculated average cost for two across cities.
- Cities like Goa and Mussoorie have higher average costs compared to others.
- Despite regional diversity, **the same few cuisines dominate all major urban areas**, suggesting a more standardized urban food culture than expected

# ★ Ratings Distribution & Relation with Cost

## User Ratings:

- Most restaurants fall between 3 to 4 ratings which **remain fairly consistent**, indicating that factors other than cost (like service, taste, ambiance) influence customer satisfaction.
- Restaurants with **moderate pricing** often receive **better ratings**, suggesting value-for-money plays a key role in positive feedback

## Correlation with Cost:

- The weak Pearson correlation value (**0.24**) supports the idea that **expensive restaurants aren't always better-rated** – customer expectations may increase with price
- Indicates **a weak positive relationship** between cost and rating.
- Higher cost doesn't always mean better rating.

## Key Insights

- ◆ **Metro cities dominate** the restaurant landscape, with Delhi and Mumbai leading.
- ◆ **North Indian and Chinese** cuisines are the most common across top cities.
- ◆ **Restaurant costs** vary by city – higher in metro areas, lower in tier-2 cities.
- ◆ **User ratings** are generally moderate, with most falling between 3 and 4.
- ◆ There is a **weak positive correlation (0.24)** between cost and rating – costlier restaurants may have slightly better ratings, but not always.

## Conclusion

=> The dataset highlights clear patterns in **consumer preferences**, **regional pricing**, and **service quality**.

=> These insights can be valuable for **restaurant owners**, **food delivery platforms**, and **market researchers** to understand where to invest and how to position their services.
